

Zinc Primer

Bardahl Zinc Primer provides long-term protection against rust and corrosion. It is highly resistant to extreme weather influences, salt, and water. The product has been tested under salt spray and conditions in boiled water.

Bardahl Zinc Primer is a high-quality cold galvanizing agent. The protective layer offers resistance to 500°C heat up, dries quickly, and can be repainted if needed. It is not a paint but a cover that consists of pure zinc. When applied correctly, it will continue to protect against rust, even if the galvanized layer is scratched. This cover is also used as spot welding paint. The product adheres to all metals and can be used to repair damaged zinc layers, welded parts, and as a primer. **Bardahl Zinc Primer**, if properly applied, will conduct electricity. It dries quickly and is economical to use.

Application

Carefully remove rust and dirt from the parts to be treated. Create surfaces made of paper that can serve as a substrate. Shake the can well before use. Spray at room temperature at a distance of 30-40 cm. Spray in light layers. After use, hold the can upside down and spray until only gas is released. This cleans the nozzle.

The spray can is filled with a solvent, which is harmless to the environment.
